

Docplanner Mobile Exercise

The goal is to create a small application for doctors with the list of available slots for each day, we'll call it 'Agenda view'.

The view consists of a list which is split into days of the week and each day includes all the slots (available times for patients to book) for this day. Doctors can navigate to the next or previous week, but they shouldn't be able to navigate to the past.

Each slot can be booked for an appointment for a patient by clicking at the slot and navigating to the new page. After completing the booking process, doctors go back to the slots list.

Previews:

<https://monosnap.com/file/03DafX72kfBFBfD263YqyfFytn1vCk>

Additional info:

To get the list of the slots, you need to make API call:

GET

`https://draliatest.azurewebsites.net/api/availability/GetWeeklySlots/{yyyyMMdd}`

{yyyyMMdd} should always be Monday

Booking the slot will not make any api call, only update the list of the slots

Nice to have:

- After refreshing the app, the list will have the booked slots remembered
- Documentation about the solution and decisions
- Tests

Good luck!
